

BAHub - Phase 14: Future Enterprise SaaS Roadmap

This document outlines the strategic roadmap to transform **BAHub** from a workspace application into a commercial B2B SaaS platform suitable for enterprise scale.

1. Multi-Tenant Scaling Strategy

While BAHub currently uses row-level database filtering scoped by `organization_id`, scaling to thousands of enterprise tenants requires a more robust architecture.

Proposed Scalability Enhancements:

- Database Sharding:** Group tenant organizations into logical shards. This isolates database resource consumption and ensures that high-volume tenants do not impact performance for others.
- Global Caching Layer:** Deploy Redis clusters to cache user preferences and project lists, reducing read traffic on primary database nodes.

3. **SSO Authentication Support:** Integrate SAML 2.0 and OpenID Connect (OIDC) protocols (e.g. Okta, Azure AD, Ping Identity) to allow enterprise clients to manage user access through their central identity providers.
-

2. Advanced Security & Compliance Roadmap

To sell to companies like Zoho, Salesforce, SAP, and Oracle, BAHub must meet strict security and compliance standards.

- **SOC 2 Type II Certification:**
 - Implement continuous monitoring using platforms like Vanta or Drata.
 - Enforce strict password complexity rules and multi-factor authentication (MFA) requirements.
 - **GDPR & Data Sovereignty Compliance:**
 - Build database isolation controls that allow deploying localized database clusters within specific regions (e.g., EU-only database shards).
 - Develop "Right to be Forgotten" service hooks to permanently delete soft-deleted records upon client termination.
 - **API Secrets Management:**
 - Transition from Django database-level Fernet key storage to dedicated HSM vaults (such as HashiCorp Vault or AWS Secrets Manager) to secure third-party integration keys.
-

3. Operations, Notifications, & Reporting

- **Enterprise Audit Vault:** Add a system ledger that records all requirements updates, user story status changes, and integration sync runs. This log must be read-only and exportable for security audits.
- **Centralized Notification Router:** Build an alert engine that routes project notifications to channels like Slack, MS Teams, and email, notifying team members when:
 - Requirements are assigned or updated.
 - Change requests are submitted or reviewed.
 - BRD/FRD documents are compiled and ready for review.

- **Advanced Reports:** Integrate analytics tools to track sprint velocity, requirement approval times, and risk mitigation rates across projects.
-

4. AI-Powered Workflow Features

- **Automated Risk Audits:** Train an AI agent to analyze requirements, identify potential project risks, and recommend mitigation steps based on past project data.
- **Requirements Optimization:** Analyze draft requirements and highlight vague or ambiguous specifications, recommending Gherkin formatting corrections before submitting for review.
- **Automated Story Decomposition:** Allow BAs to upload business briefs and auto-generate draft requirements and user story backlogs.
