

Business Requirements Document (BRD)

Project Name: BAHub Workspace Suite
Document Version: 1.0
Status: APPROVED
Target Audience: Executive Sponsors, Product Management, Engineering Leads
Date: July 2, 2026

Document Control

Version History

Version	Date	Author	Description of Changes
0.1	June 15, 2026	Devon Miller (Lead BA)	Initial Draft compiling stakeholder requests.
0.5	June 25, 2026	Samantha Vance (CPO)	Incorporated feedback on multi-tenancy rules.
1.0	July 02, 2026	Devon Miller (Lead BA)	Baseline finalized for formal sign-off.

Sign-off Approvals

Role	Approver Name	Signature State	Date
Project Sponsor	Sarah Jenkins	Signed Off	July 02, 2026
Chief Product Officer	Samantha Vance	Approved	July 02, 2026
Lead Business Analyst	Devon Miller	Approved	July 02, 2026

1. Executive Summary

1.1 Project Context

BAHub is an enterprise SaaS platform engineered to address workflow fragmentation within the Business Analysis and Product Management functions. By providing a single workspace for stakeholder mapping, requirement cataloging, backlog management, SWOT/GAP analysis, meeting documentation, and external tracker synchronization (Jira/Confluence), BAHub reduces operational overheads and prevents requirement drift.

1.2 Business Value Proposition

BAHub consolidates the software requirement gathering lifecycle into a secure, multi-tenant workspace. It eliminates duplicate data entry across spreadsheets, wikis, and issue trackers, shortening development cycles and ensuring 100% requirements-to-story traceability.

2. Business Drivers & Goals

- **Process Consolidation:** Replace five disconnected software tools (Excel, PowerPoint, Word, Miro, Slack) with a unified, context-aware command center.
 - **Traceability Assurance:** Enforce schema-level links from raw business requirements down to user stories and test scripts, mitigating scope creep.
 - **Collaboration Acceleration:** Enable real-time co-authoring with automated typing and presence broadcasts, reducing requirements alignment duration by 30%.
 - **Audit Compliance:** Log every user session and change request to maintain high-integrity histories for enterprise audits.
-

3. User Personas & Workspace Roles

BAHub enforces tenant separation and supports role-based access control (RBAC). The primary user profiles are:

1. **Business Analyst (BA):** The primary operator. Creates projects, maps stakeholders, details requirements, constructs user stories, drafts SWOT/GAP tables, logs meetings, and triggers synchronization.
2. **Product Owner (PO):** Reviews and signs off oncompiled documents, approves change requests, and prioritizes backlog cards on the kanban board.
3. **Project Manager (PM):** Monitors active metrics dashboards, coordinates action item deadlines, and manages risks.

4. **Contributor / Developer:** Views requirements and stories assigned to active projects, updates backlog statuses, and tracks tasks.
 5. **Stakeholder / Client Viewer:** Read-only access to specific project dashboards, stakeholder matrix maps, and compiled document reviews.
 6. **Workspace Tenant Administrator:** Manages organization details, seats limits, user sessions, integration vaults, and subscription tiers.
-

4. Business Requirements Catalog

The following high-level business requirements form the foundation of the BAHub Workspace:

BR-101: Secure Multi-Tenancy & Data Separation

- **Goal:** Isolate data at the database level by organization container.
- **Rule:** Under no circumstances should User A from Organization X be able to query, access, or modify files belonging to Organization Y.
- **Traceability:** Scoped to the `Organization` and custom `User` models.

BR-102: Structured Requirements Management

- **Goal:** Establish a unified, auto-sequencing requirements database.
- **Rule:** Require priority (High, Medium, Low), category (Functional, Non-Functional, Technical, UI), and status lifecycle (Draft, Review, Approved, Rejected). Automatically assign unique, sequential identifiers (e.g. `REQ-001`) per project.
- **Traceability:** Maps to `Requirement` model and `RequirementsPage` view.

BR-103: Visual Stakeholder Mapping

- **Goal:** Maintain an active registry of project stakeholders with Power and Interest attributes.
- **Rule:** Render registered stakeholder profiles automatically on a visual 2x2 grid representing Power/Interest alignments.
- **Traceability:** Maps to `Stakeholder` model and `StakeholdersPage` view.

BR-104: Agile Story Backlog Sync

- **Goal:** Bridge requirements with engineering execution.

- **Rule:** Allow decomposing requirements into User Stories with Gherkin acceptance criteria. Synchronize these cards with external Jira instances via encrypted API integrations.
- **Traceability:** Maps to `UserStory` model and `Integrations` sync controller.

BR-105: Strategic & Alignment Tools

- **Goal:** Embed strategic insights directly within project scopes.
 - **Rule:** Provide structured SWOT quadrant grids and Gap Analysis records (Current vs. Future State and bridging action plans).
 - **Traceability:** Maps to `SWOTAnalysis` and `GapAnalysis` models.
-

5. Scope Boundaries

5.1 In Scope

- Setup of organizational workspace domains and team member provisioning.
- Requirements authoring, story splitting, and kanban agile board workflows.
- Real-time WebSocket presence and collaborator notifications.
- Dynamic document compilation with sign-off validations.
- PDF and Word export downloads.
- Encrypted credential storage for Jira/Confluence syndication.

5.2 Out of Scope

- Native code repository integrations (e.g., Git commit hooks).
 - General team messaging chat channels (replaces with links).
 - Custom SMTP server administration.
-

6. Assumptions & Constraints

6.1 Assumptions

- **AS-1:** Enterprise tenants have provisioned API integration accounts on Jira/Confluence.
- **AS-2:** Team members have standard web browser environments supporting secure WebSocket connections (`wss://`).

6.2 Constraints

- **CO-1:** SQLite database constraint during development requires standard Django ORM compatibility for PostgreSQL production deployments.
- **CO-2:** Document compilers must conform strictly to standard A4 formatting templates to ensure print layout integrity.
